Here are presentation notes for the two graphs, structured for easy use during your presentation:

Slide Notes: Visualization & Model Insights

Graph 1: SKU66 — Declining Product (Discontinued)

What the graph shows:

The blue line (2017–2020) shows SKU66 was once a top-performing product, generating ~$3M/month in sales value.

Starting in late 2019, sales began a sharp, irreversible decline, dropping to near-zero by early 2020.

The red dashed line (2021 forecast) correctly predicts near-zero sales for the entire year.

Key talking points:

"This is a textbook example of a product life cycle ending — likely due to discontinuation, loss of market share, or regulatory changes."

"A naive model might have forecasted $3M/month based on 2017–2019 averages, which would have led to massive overstocking and wasted inventory costs."

"Our Holt-Winters model correctly detected the structural break and adapted, saving the business from a costly forecasting error."

Business implication:

Prevents overproduction and excess inventory holding costs.

Signals to supply chain teams to wind down procurement for this SKU.

Graph 2: SKU62 — Healthy High-Value Product

What the graph shows:

The green line (2017–2020) shows a volatile but high-value product, with sales ranging between $0.2M and $1.75M/month.

Notice the deep seasonal dips (e.g., mid-2019, early 2020) — these are recurring patterns, not random noise.

The red dashed line (2021 forecast) captures this seasonality, projecting peaks around $1.6M and troughs around $0.4M.

Key talking points:

"SKU62 is a high-value, seasonally-driven product. The model successfully identified the recurring annual pattern — peaks in Q2/Q3 and dips in Q1/Q4."

"The forecast aligns with historical seasonality, giving the supply chain team confidence to plan inventory around predictable demand swings."

"This is exactly the kind of insight that prevents stockouts during peak months and overstocking during slow months."

Business implication:

Enables proactive inventory planning aligned with seasonal demand.

Protects revenue by ensuring stock availability during high-demand periods.

Combined Takeaway (for the slide conclusion):

"Together, these two graphs demonstrate the model's intelligence: it doesn't just extrapolate — it adapts. It recognizes when a product is dying and when a product is seasonal, delivering forecasts that are both accurate and actionable for business decision-making."

Bonus tip for presenting:

Point to the sharp drop in SKU66 and say: "This is where most simple models fail — but ours caught it." Then point to the repeating peaks in SKU62 and say: "And this is where our model adds value — capturing seasonality that a simple average would miss." This contrast makes your methodology look sophisticated and business-aware.
